

How To: Clear a coin Jamb

This is for the Guardian 6000 mechanism. Quantum 800 series in on another how to document.

1

Open the top door first and investigate. Make sure those three red coils stay clean or you'll have problems.

2

Open the lower door and look for coins here.

3

Most likely you will have to pull the entire section out. Push in tab (larger yellow arrow) and rotate section out.

4

This section will remove, be careful of the wiring harness.

5

Last area to check is on the back. Pry the bottom out as shown THEN pull down to remove panel further.

note

Most coin jams can be fixed within a minute once you get these techniques down. Check out our service page for videos that might help.
